Robinson Saturday. Olive Sanderson spent Sunday with Ora Workman and wife at Pricetown. Misses Stella Aber and Fanny Chancy were guests of relatives at Pricetown Sunday.

James Baker and two daughters, of May Hill, are visiting relatives here. John Smith has bought the farm owned by A. O. Davall of Hamer town

OFFICERS AND MEN CHANGE DRESS FIVE TIMES.

Instance of What the Men Are Sometimes Required to Do.

Four thousand officers and blue ackets, constituting the crews of five first-class battleships and one gunboat, in the New York navy yard, changed their uniforms simultaneously five times on a recent Sunday, says the Cyrus Shaffer made a business trip New York Times. The reason of much changing of dress was due to the regulation which requires that each officer and man must at all times wear cousin, Lizzie Handley, and daughter a uniform to conform with that worn by the commanding senior officer

he fleet or squadron. Rear Admiral Robley D. Evans, the commander-in-chief of the North Atlantic fleet, five of whose battleships are at the navy yard, is, of course, the ranking officer at the yard. He is away on leave of absence. Next to him comes Rear Admiral Coghlan, the commandant of the yard. After him comes Real Admiral Davis, commanding the second division of the battleship squadron However, it was said absences of commanding officers were frequent and this made the ranking a good deal of a puzzle to anybody but a navy man.

At any rate the officers and men of the Kearsarge, Kentucky, Alabama, Maine and Missouri and the second class gunboat Dubuque had to make Rebecca Stults were entertained by some lightning changes of dress. The John Washburn and family at their changes began at reveille, when a signal from the Alabama showed that the commanding officer was going

reakfast dressed in blue. This information was quickly wigwagged to all the ships, and when the men lined up for mess each of family, of Turkey, spent Sunday with them was clad in the blue uniform of lounged about the decks or strolled around the yard. About ten o'clock another signal was wigwagged from the flagship. The signal was to the effect that the ranking officer was wearing a white cap. Ten minutes later all the officers and nearly 3,500 men had discarded their caps of blue and had reappeared in caps made of

The next change was at the lunch hour. Hardly had that meal ended when there was some more wigwagging between the ships. The commanding officer was in the full uni-form of white duck. Half an hour later the officers still on the ships and every blue-jacket on ship or in the yard had returned from a hurried visit to his quarters, where he had changed

the blue for the white duck. Just before the dinner bell another signal appeared. "Off with the white and on with the blue" is a liberal translation of what the man with the signal flags said. It was nearly mandown, but the interval between signal and mess call was sufficient for another rapid change of garb, and when the "last call for dinner" sounded the decks of every battleship and the little gunboat showed formations of smart seamen, every one of whom was clad in the full blue uniform of the United States service.

"I believe we hold the record in shooting, but I know we hold it when place and Miss Lucille Spargur, of remarked an officer, as he darted around a 12-inch turret on his way to his quarters to change his white duck for a blue uniform.

New Explosive. Vice Consul Stephens, of Plymout England, writes about a new explosive which it is claimed will reduce climatic conditions. "It is reported that Messrs. Kynoch (Limited), one of the government manufacturers of cordite, claim to have produced an explosive which retains the main constituents of cordite, but which, because of ingredients added, will reduce climatic effects by one-half. Instead of a round cord, as in cordite, a ribbon is the form of manfacture, and it is claimed that this explosive will not corrode the barrels Young, of Harshaville, are visiting so much as the older form, that there is less friction and consequently greater accuracy. Experiments have been made which show that after firing the new explosive the 'deposit does not

injure the barrel if left in it for some hours afterward." Nimble Animals. Although the flea holds the record for agility of movement among insects miles an hour, could it continue jump ing without cessation and without the ing, it has but little the better of the jumping mouse found in the African deserts, which clears ten feet at a jump at the rate of 800 feet a second. Compared with these, the larger animals are sloths, for the ostrich moves 98 feet a second, the gazelle 85, and the Russian boarhound, swiftest among dogs, covers only 75 feet a second. a crowd here Thursday. Ten were The swallow, fastest among birds, covers only 400 feet in a second, or just one-half what the African mouse could fifth of a grain of the standard weight accomplish were the latter to sustain to be passed, and the remedy allow-

Population of China.

The latest authoritative information obtainable, according to Consul Anierson, of Amoy, places the popula tion of the Chinese empire at 432,000,-000. How comparatively few of the Chinese people are brought in contact with the world outside the flowery kingdom is made apparent by the fact that the total population of the treaty ports is only 7,000,000.

Wasteful Custom

The English clergy are protesting that more than 900 tons of rice are annually wasted at weddings by being thrown after the happy pairs. More than \$20,000 is yearly spent for rice.

SPECIES THAT MAKES ITS OWN DARK LANTERN.

They Prowl Around in the Darkness at Bottom of the Sea and Flash Their Light at WILL

"Did you ever see a burglar fish?" queried the humorous scientist at the commission the other afternoon. The Washington Star reporter was compelled to admit that while he had read of "Raffles, the amateur cracksman,' 'and had perused one or two dime novels, that a "burglar fish" was decidedly new.

"Well," continued the scientist, with a proclivity for the ludicrous, "we have been making some researches lately, and one of the things we have discovered is the burglar fish. Of course, that is not the scientific and dignified name of this piscatorial species, but his attributes and equipment are such that he would have no trouble in becoming a deep-sea robber. Most deep-sea fishes posses luminous organs, and this particular class to which I refer have pliable muscles in connection with the luminous organs which enable the fish to turn the organs inward at will, and thus extinguish the light. So you see. they can prow! around in the darkness at the bottom of the sea, suddenly display their natural dark lantern, secure their pelf, and hie themselves to the tall sea grass in the distance. We have no way of proving that this ever has been done, because there is no record that any fishes ever have been indicted and convicted for this offense, but I nerely mention it as a possibility. It has been suggested, however, by one of my fellow scientists at the fish commission that these finny marauders are gathering all the ingots of gold which ave sunk with the historic treasur ships, and have stored the wealth in safe place, awaiting that transmigraion of the soul which will make of them men, instead of fish. Then they will haul their ill-gotten gains from the bottom of the sea and live in happiness and luxury ever after. Of course, you understand this, too, is only a

The reporter admitted that it looked very much like a theory.

"Seriously speaking." continued

signtist, "the fish commission bas male some commendable discoveries. One thing we know is that deep sea Subes are not black, as has been asserted for many years, but are brilliantly polored, the black skin serving merely as an effective background to the varied tints produced by their luminous organs. These organs, though they vary remarkably in details in the different species, yet show a general semblance to each other and to the similar organs of cuttlefishes. These luminous organs consist essentially of gland cells, which are entirely filled with secreting nuclei, and may be regarded as the source of light. Under these coils lies usually a thin layer of narrow and closely packed cells, which act as a reflector. Between the luminous cells and the skin are interposed cells of strong refractive power, which may be regarded as forming a lens. and the whole organ is enveloped, ex-

cept on the side nearest the skin, in a mantle of dark pigment cells. The luminous organs are found in arious parts of the body and occur both singly and in groups. Their great diversity in structure is supposed to indicate a corresponding diversity in the color of the light emitted by them. The exact purpose of these organs can only be conjectured. The structure of the eyes of deep sea fishes is modified for adaptation to the phosphorescent light emitted by the luminous organs.

"As these organs are distributed over the body in an arrangement peculiar to the species, and shine with light of various hues, it is inferred that they serve, like the pigment cells of daylight animals, to form a characteristic specific pattern. So far from being black, then, these fishes must present weirdly gorgeous spectacles, Illuminat ed as they are smid the dark surround

"In some cases the luminous organ of deep sea fishes shine not outward but inward. Such illuminating organs are found most frequently in the eye cavity, and the probable interpretation of them is that they originally shone outward, but becoming covered with skin folds, their purpose has become modified into supplying the eyes of the fishes with increased sensitiveness to differences of color between species."

Trial of the Pyx.

elected samples of the product of the doze of this valuable medicine is worth English mint are tried by jury. This a trifle over \$2, but those who have curious institution is caused the trial taken it aver that it is worth ten times of the Pyx. One of every 2,000 of the that much for its splendid effect on the gold coins struck is set apart for this brain cells. test, and one from each 60 pounds of silver coins. The coins are tested both as to weight and fineness. A sovereign must come up to within oneance as to fineness is two-thousandths (or 2.00 per 1,000). During the year ended June 30, 1905, gold to the value of \$39,000,000 was coined in the London mint-a decrease of \$17.560,000, or nearly one-half, as compared with the De 'Sociated Charities done start a previous year. Silver, which is only coal-an'-soup fund at de corner, an' coined in London, amounted to \$1,-

Its stigmas you see, He in a part of it that bees wouldn't visit because it is too unhandy and remote. But these stigmas must be fertilized, or the flower per ishes. Hence the orchia loads the bee with its sap, making them disgrace fully tipsy, and the poor, staggering lurching bees, when they can drink no more, fall and roll into the unin viting place where the stigmas are, and with their pollen fertilizing these stigmas, they keep the orchid flourish ing on the earth."

MUSK FOR TYPHOID PEVER Great Cost, However, Will Prev Its Coming Into Gen-

eral Use. Musk is known to the average per son merely as the basic principle of certain perfumes. Even to many medical men a knowledge of its qualities does not extend beyond this fact, yet demonstrated conclusively that it is an unrivaled remedy in the treatment of typhoid fever and diphtheria and invaluable as a stimulating tonic for the brain, acting as it does when conveyed by the blood stream with a Our best wishes go with them. powerful invigorating effect on the

nerve cells of the lower brain. Though it would prove a boon brain workers or anyone suffering at will prevent a general use of it, for its action is transitory and the doses must be large and frequent in order to have the desired effect.

The musk used in the western world comes direct from China and is usually shipped to England, whence it is distributed to other civilized countries. The grains of musk are contained in pod or husk. In preparing the musk for commercial and medical uses the pods are cut with scissors and the grains shaken out, after which the pot employed to paper the school house. is stretched and scraped with a fine

knife. It is only the first grade of musk that is valuable as a medicine and its value is vastly greater than that of gold, for its export price is \$25 a dram

r \$200 an ounce. Owing to the great cost of pure musisubstitutions of the inferior grades are not uncommon, and in administering it as a medicine, particularly as a brain tonic, this tendency toward substitution is one of the hardest things to guard against. In cases where it used as a stimulant for a tired brain the dose is five grains every two hours, and in most instances not less than three or four doses are necessary before the desired result is produced, a complete invigoration, though beneficial results will be noticeable first administration. from the Every year in London a number of there are 60 grains in a dram, each
